

Siri Baja bio IBG

Pertanian lestari melalui Bioteknologi
Inovatif

Apa yang terdapat dalam tanah semula jadi?

Apa yang terdapat dalam tanah semula jadi?

1. Mikroorganisma.

- *Penguraian bahan organic.*
- *Kitaran nutrient.*
- *Pembentukan humus.*
- *Pengikatan Nitrogen.*
- *Membantu tumbesaran.*

2. Bahan organic.

- *Sebagai sumber nutrien tumbuhan.*
- *Sebagai sumber makanan untuk bacteria.*
- *Memulihkan nutrien tanah.*

Apa yang terdapat dalam tanah semula jadi?

3. Nutrient makro dan mikro.

- *Carbon, Hidrogen, Oksigen*
- *Nitrogen*
- *Fosforus*
- *Kalium*
- *Kalsium*
- *Magnesium*
- *Sulfur*
- *Mangan*
- *Tembaga*
- *Zink*
- *Molybdenum*
- *Boron*
- *Klorin*
- *Besi*

Penting untuk tumbesaran tumbuhan, membentuk makanan dan sebagainya.

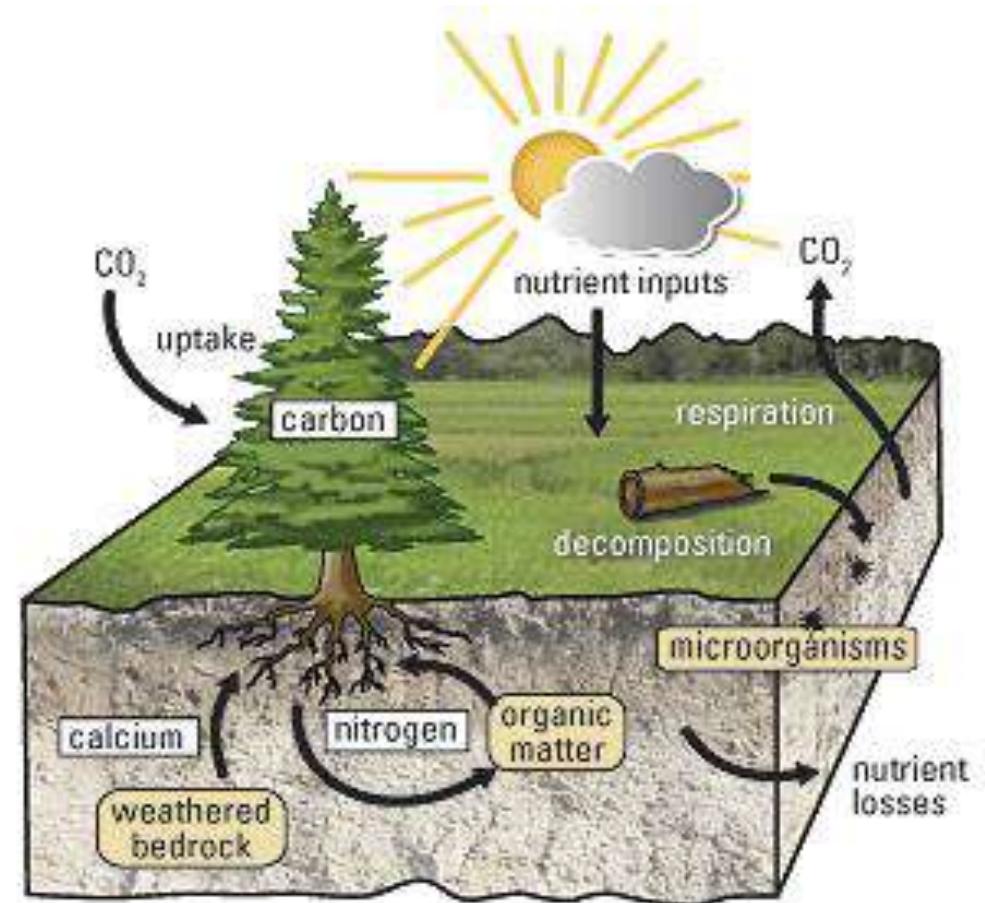

Kenapa perlindungan tanah adalah penting?

- *Tanah – memberi sumber air, nutrien, udara dan perlindungan kepada tumbuhan.*
- *Tumbuhan – memberi sumber makanan dan perlindungan kepada manusia.*
- *Manusia – tetapi manusia hanya cuma merosakkan tanah dengan baja kimia.*

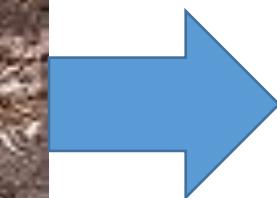

Kenapa perlindungan tanah adalah penting?

- *Apabila tanah menjadi rosak disebabkan oleh pengasidan tanah, imunisasi tanah akan menjadi lemah. Tanah yang lemah tidak akan menghasilkan tanaman yang baik dan tanaman itu akan mengalami banyak penyakit. Tanaman itu tidak akan menghasilkan makanan yang berkualiti kepada manusia. Jadi pemulihan tanah dan kualiti hidup manusia adalah penting.*

Peringkat hutan dara.

Peringkat pembukaan tanah.

Kepentingan baja kimia

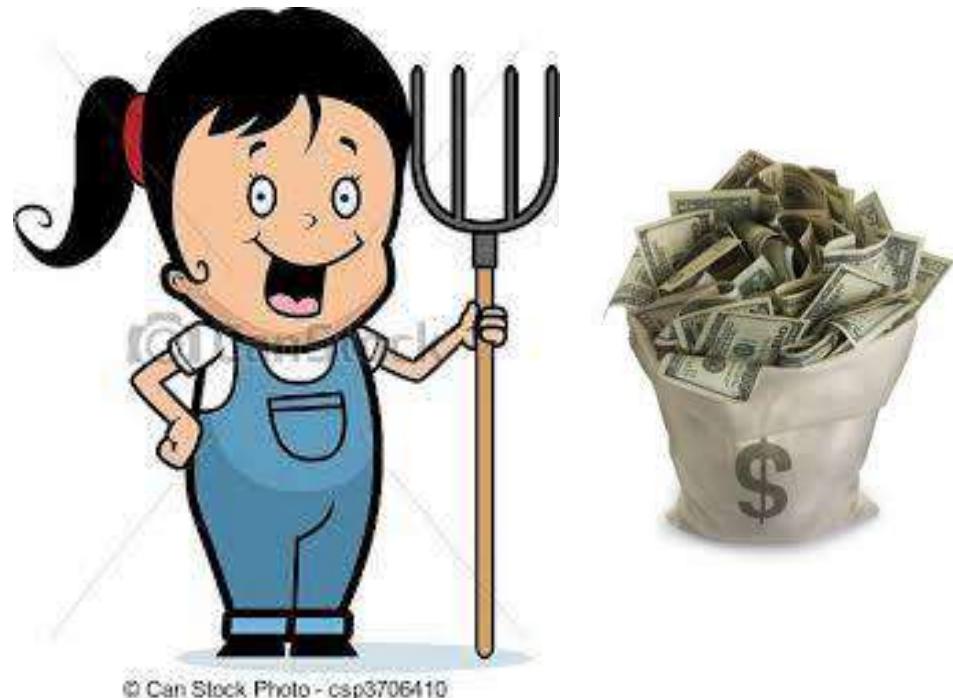

- *Tanah mengandungi simpanan semula jadi nutrien tumbuhan, tetapi sebahagian besarnya simpanan ini adalah dalam bentuk yang tidak tersedia kepada tumbuh-tumbuhan, dan hanya sebahagian kecil dilepaskan setiap tahun melalui aktiviti biologi atau proses kimia. Proses ini adalah terlalu lambat untuk mengimbangi penyingkiran nutrien oleh pengeluaran pertanian dan untuk memenuhi keperluan tanaman.*

Kepentingan baja kimia.

- *Oleh itu, baja kimia direka untuk menambah nutrien sudah ada di dalam tanah. Penggunaan baja kimia, baja organik atau biobaja mempunyai kelebihan dan kekurangannya dalam konteks bekalan nutrien, pertumbuhan tanaman dan kualiti alam sekitar.*

Kebaikan dan keburukan baja kimia.

Kebaikan.

- *Tanaman tumbuh dengan pantas dan besar.*
- *Nutrien yang mencukupi.*
- *Sokongan pertumbuhan.*
- *Meningkatkan hasil tuaian.*

Permulaan.

Kebaikan dan keburukan baja kimia.

Keburukan.

- *Ketoksikan dan pencemaran.*
- *Kerosakan tanah dan menyebabkan tanah berasid.*
- *Mengganggu ekologi tanah semula jadi.*

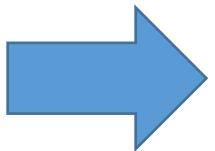

Penggunaan beterusan¹².

Tanah yang rosak vs tanah yang sihat.

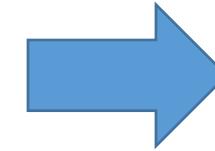

Jenis baja.

Baja kimia.

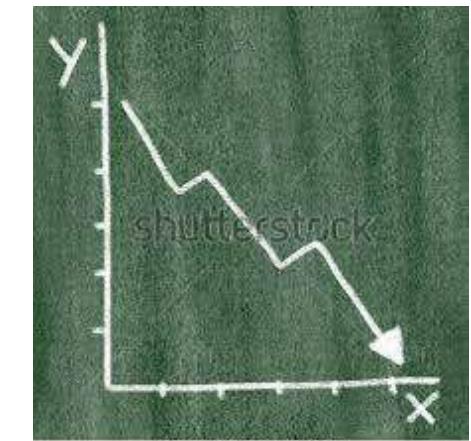

Ubat doktor.

*Kesan yang
cepat, tetapi
banyak
kelemahan.*

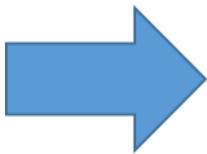

- Penggunaan berpanjangan baja kimia = Penggunaan ubat yang berpanjangan = Walaupun cepat dan berkesan, tetapi mempunyai banyak kelemahan.

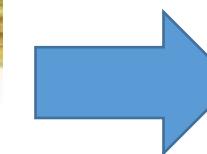

Jenis baja.

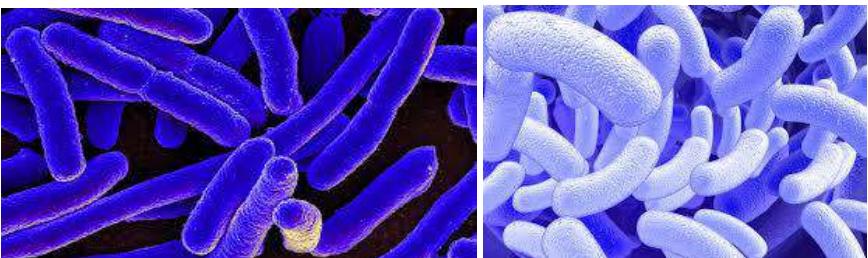

Bahan organik.

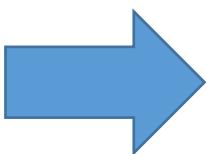

Ubat tradisional.

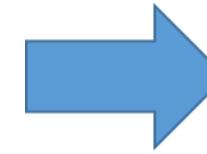

*Kesan perlahan,
tidak mempunyai
kelemahan.*

Mikrob.

Suplemen.

*Lebih selamat dan
boleh dipercayai,
penggunaan jangka
panjang dapat
membaiki dan
melindungi tanah.*

*Apa itu baja
bio IBG?*

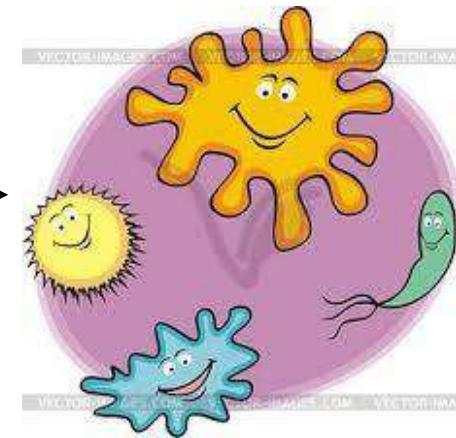

Cara yang terbaik untuk pemulihan tanah.

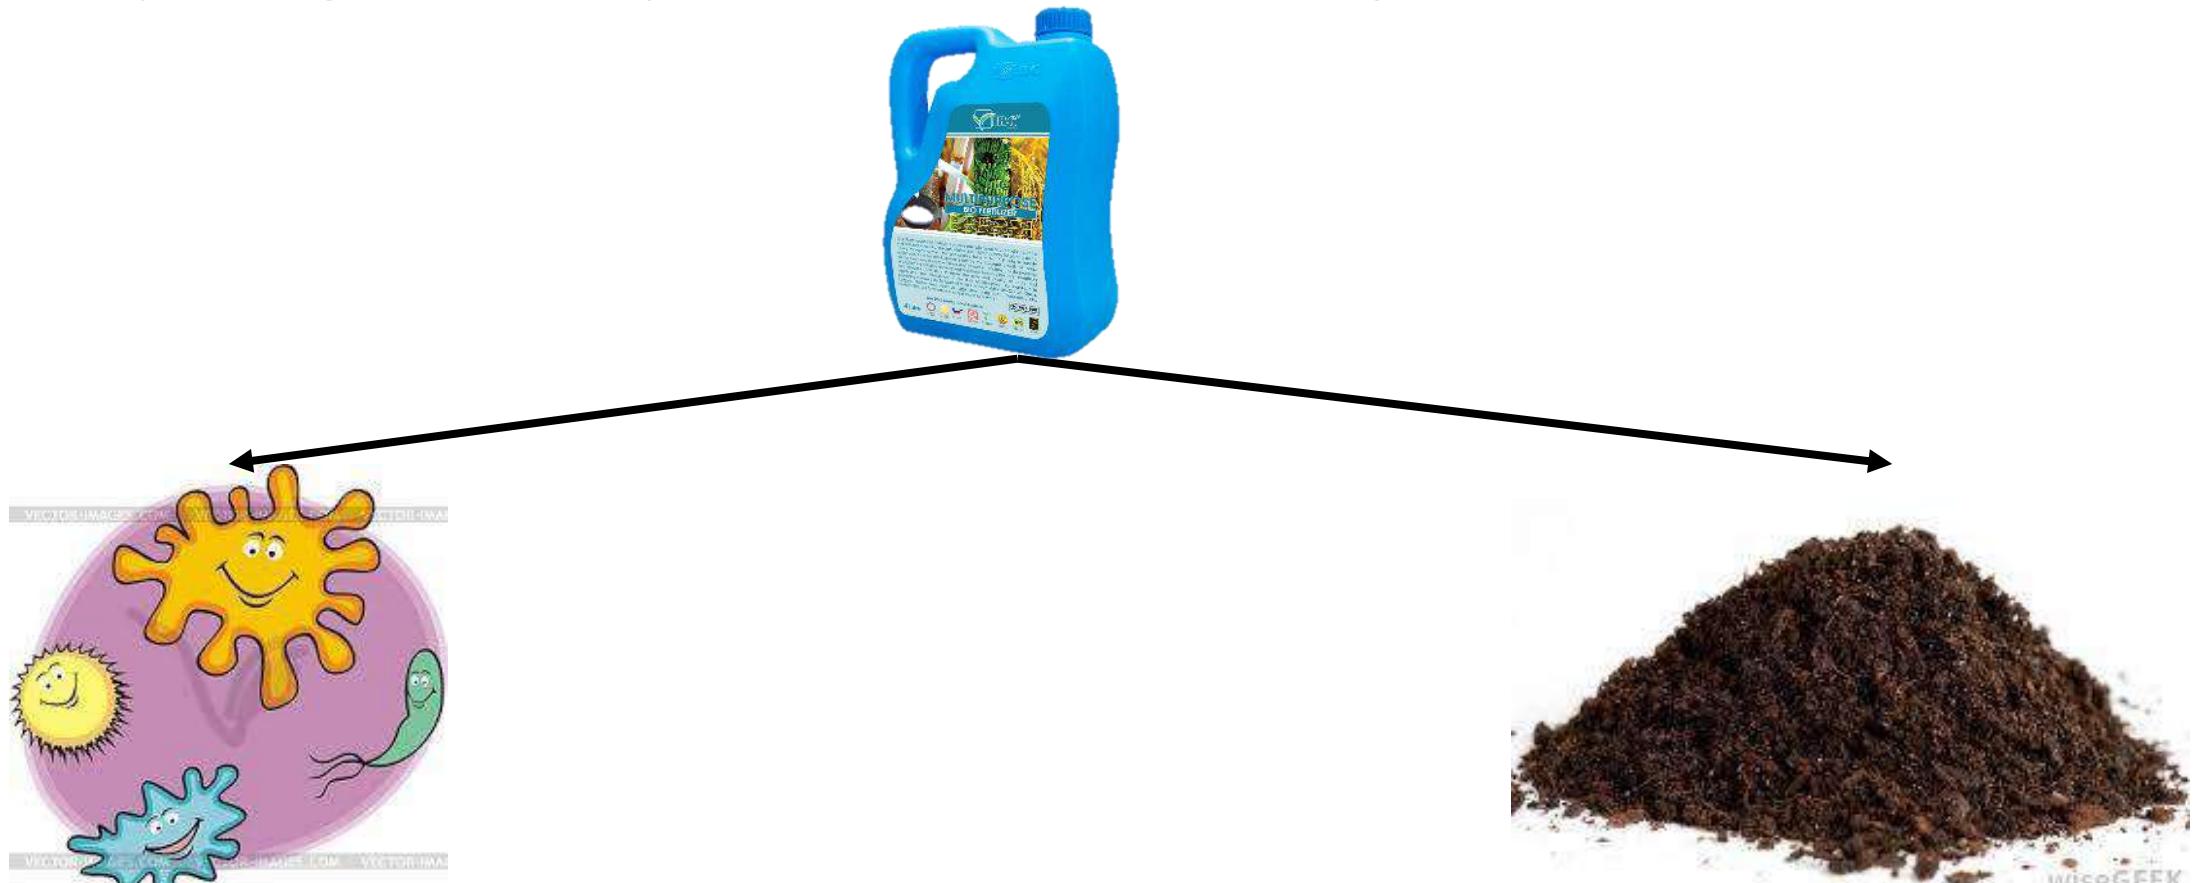

Bahan organik.

Mikrob.

Apa yang terdapat di dalam baja bio IBG?

Mikrob berfaedah tidak kurang daripada 10^7 cfu/ml.

Aloe vera, ekstrak rumpai laut, asid humik, asid amino, emulsifi ikan.

- *Baja bio dalam pasaran mesti mengandungi minimum 1 juta cfu/g bacteria untuk dikelaskan sebagai baja bio. Dengan teknologi kami, baja bio IBG telah mencapai tidak kurang daripada 10 juta cfu/g bacteria.*
- *Mikrob tidak boleh hidup bersendirian tanpa bahan organik, ia perlu dilengkapi dengan bahan organik dan nutrien makro dan mikro untuk memulihkan tanah dengan berkesan. Campuran bahan organik kami yang teratur akan membolehkan mikrob hidup di dalam tanah.*
- *Dua kombinasi ini adalah serupa dengan element dalam tanah yang semulajadi. Baja bio IBG dapat membekalkan elemen yang menyeluruh untuk tumbuhan untuk tumbuh dan menyerap lebih baik.*

Rumusan baja bio IBG.

Mikrob berfaedah - Meningkatkan penyerapan dan mengurai bahan organik, tidak kurang daripada 10^7 cfu/ml.

Aloe vera, ekstrak rumput laut, asid humik, asid amino, emulsifi ikan – Meningkatkan kandungan bahan organik tanah.

Aplikasi baja bio IBG.

Kadar.

70%

Baja kimia.

Harap perhatikan bahawa baja bio IBG digunakan sebagai pengganti 30% dari baja kimia. Oleh itu, kos bahan anda tidak berubah setelah menggunakan baja bio IBG.

30%

Baja bio IBG.

Mengapa pilih Baja Bio IBG

- Meningkatkan produktiviti tanaman.
- Memberi sokongan yang berdaya maju dari segi ekonomi.
- Mengelakkan kesihatan tanah.
- Berkesan dalam membantu tumbuhan untuk menyerap nutrien.
- Mengurangkan kadar baja kimia.
- Mengurangkan penyakit akar tumbuh-tumbuhan.
- Menjimatkan kapasiti stor baja.

Seseorang yang sihat jarang mendapat apa-apa penyakit.

Tanaman yang sihat jarang mendapat apa-apa penyakit.

Setelah 3 tahun menggunakan baja bio IBG

Setelah 3 tahun menggunakan baja bio IBG

Selepas tanah telah dirawat dengan Baja Bio IBG, mikrob boleh membantu dalam penguraian bahan organik dan dalam mineralisasi tanah. Ia melepaskan Nitrogen dan Fosforus semasa penguraian dan dengan itu baja N dan P dapat dikurangkan.

Chapter 1 Potential and Possible Uses of Bacterial and Fungal Biofertilizers

Francesco Gentili
Ari Jumpponen

INTRODUCTION

During the past four decades we have witnessed the doubling of the human population and a concurrent doubling of food production (Vance, 2001). Plant nutrition has played a key role in this dramatic increase in demand for and supply of food. Increases in crop production have been made possible through the use of commercial man-made fertilizers. The use of nitrogen (N) fertilizer has increased almost ninefold and phosphorus (P) more than fourfold (Vance, 2001). The tremendous increase of N and P fertilization, in addition to the introduction of highly productive and intensive agricultural systems, has allowed these developments to occur at relatively low costs (Schultz et al., 1995; Vance, 2001). The increasing use of fertilizers and highly productive systems have also created environmental problems such as deterioration of soil quality, surface water, and groundwater (Schultz et al., 1995; Socolow, 1996).

Environmental

Banyak kajian menunjukkan bahawa penggunaan baja bio membantu dalam pertumbuhan tumbuhan dan pemuliharaan tanah lestari secara keseluruhan.

ABSTRACT: In order to study effects of biological fertilizers, chemical fertilizers and bacterial growth enhancers (PGRP) on yield and yield factors of wheat (*Triticum aestivum*) and to reduce chemical fertilizers and improve soil and plant nutrition, an experiment was carried out in research field of Agriculture and Natural Resources University of Ramin, Iran in crop year of 2009-2010. The experiment was performed in split plot-factorial design arranged in a complete randomized block design with three replications. In this study, chemical factor was the base plot in three levels (Control, half of local recommended and total local recommended) and the biological fertilizer (Nitroxin and bio-phosphor) were the secondary factors with three levels (Control, 0.5 and 1 liter per hectare). Results indicate that the use of biological fertilizers lead to significant differences in grain number per spike, grain weight, biological yield and harvest index. Combined treatments of microorganisms (Azotobacter and *Pseudomonas fluorescens*) and chemical fertilizers had the greatest impact on the studied traits. Analyze of variance suggest that highest yield of grain was achieved by complete use of all three fertilizers in recommended fertilizer rate compared to control treatment. Overall, the results showed that, biological fertilizers have a significant role in improving yield and yield components of wheat, and Bio-fertilizers with chemical fertilizers may be useful to increase the yield and reduce environmental pollution.

Key words: wheat, yield, yield components, Biofertilizer.

INTRODUCTION

Given the increasing world population, more than ever feel the need to increase food production. For this purpose, four solutions (increase in area under cultivation, yield per unit area, yield per unit of time).

While utilize Bio-fertilizers importing a large population of effective microorganisms in the active field of root system.

Abstract: The full dependency on chemical fertilizers in oil palm plantation poses an enormous threat to the ecosystem through the degradation of soil and water quality through leaching to the groundwater and contaminating the river. A greenhouse study was conducted to test the effect of combinations of biofertilizers with chemical fertilizer focusing on the soil fertility, nutrient uptake, and the growth performance of oil palms seedlings. Soils used were histosol, spodosol, oxisol, and ultisol. The three treatments were T1: 100% chemical fertilizer (NPK 12:12:17), T2: 70% chemical fertilizer + 30% biofertilizer A (CF + BFA), and T3: 70% + 30% biofertilizer B (CF + BFB). T2 and T3, respectively increased the growth of oil palm seedlings and soil nutrient status but seedlings in oxisol and ultisol under T3 had the highest in almost all parameters due to the abundance of more efficient PGPR. The height of seedlings in ultisol under T3 was 22% and 17% more than T2 and T1 respectively, with enhanced girth size, chlorophyll content, with improved nutrient uptake by the seedlings. Histosol across all treatments has a high macronutrient content suggesting that the rate of chemical fertilizer application should be revised when planting using the particular soil. With the reduction of chemical fertilizer by 25%, the combined treatment with biofertilizers could enhance the growth of the oil palm seedlings and soil nutrient properties regardless of the soil orders.

Keywords: plant growth promoting rhizobacteria; oil palm seedlings nursery; biofertilizers; chemical fertilizer

1. Introduction

The agriculture sector is considered as one of the economy pillars in many developing nations [1]. However, continuous use of agrochemicals such as chemical fertilizers and pesticides in this sector is detrimental to human health such as infant methemoglobinemia [2] and which also cause ecological imbalance [3,4]. The use of chemical fertilizer will also cause air and ground water pollution resulting

The temperature ambience was 28–33 °C. The experiments were conducted in the Complete Block Design (CBD) with four replicates for each treatment in a single trial. Liquid biofertilizer A (BFA) (effective microorganisms: 1×10^7 CFU/mL) and biofertilizer B (BFB) (effective microorganisms: 1×10^6 CFU/mL) were purchased from local Malaysian manufacturers. BFA consists of *Bacillus* spp. such as *Bacillus cereus* JCM 2152, *Bacillus amyloliquefaciens* strain MPA 1034 and *Bacillus tequilensis* strain 10b *Lactobacillus* spp.; *Azospirillum* spp. and *Rhizobium* spp. Meanwhile, BFB consists of a very diverse group of microbes: Actinomycetes such as *Kocuria rhizophila*, *Arthrobacter methylophilus*, *Bacillus* spp. such as *B. pumilus*, *B. subtilis* (subspecies *Spizizenii*), *B. vallismortis*, *B. Thurengiensis*, *B. mycoides*, *B. mucilaginosus*, *Brevibacillus reusseri*, *Paenibacillus polymyx*, and *Paenibacillus azoreducens*. *Azospirillum brasiliense* and fungus such as *Aspergillus niger* and *Aspergillus awamori*; yeast such as *Saccharomyces cerevisiae* Hansen were also the beneficial microbes contained in the biofertilizer. The micro and macro nutrient with the organic matter of the biofertilizers were listed in Table 2. NPK blue with the formulation ratio of (12 N:12 P₂O₅:17 K₂O: 2 MgO + TE) was used as the chemical fertilizer. The experiment consists of three treatments: [T1] 100% of CF, [T2] 70% CF + 30% BFA, and [T3] 70% CF + 30% BFB. The amount and dose of fertilizers applied was listed in Table 3. Treatments were done for four rounds (every 30 days).

depicted the highest chlorophyll reading throughout the last two months of treatment period. The chlorophyll content of seedlings in T3 planted using histosol declined after 30 DAT but increased after 41 DAT and show a slight change from 67 and 131 DAT. Seedlings in ultisol under the same treatment reached the highest peak at 41 DAT with the chlorophyll content reading of 63.18 but decreased to 62.50 at 131 DAT. A steady increase in the chlorophyll content was seen in seedlings under oxisol but it remained the lowest reading throughout the last three months during the treatment period. The addition of biofertilizers seems also to have a positive impact on the chlorophyll reading of the seedlings.

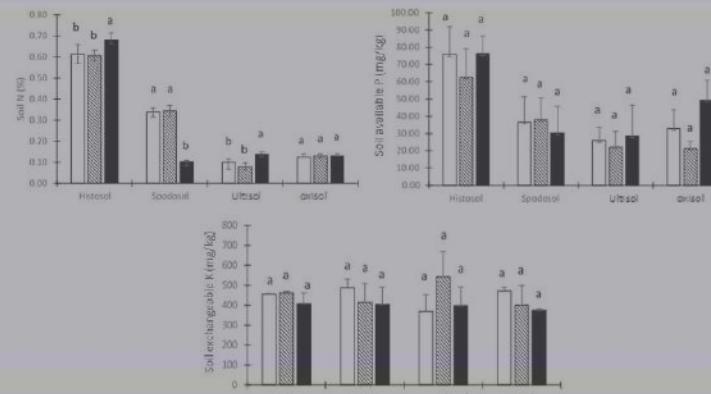

Semua anak benih dalam histosol, ultisol, dan oxisol di bawah plot T3 mempunyai ukuran lilitan tertinggi

different letters represent significant differences in Tukey's HSD comparison. Means sharing the same letter across treatments do not differ significantly at p-value ≤ 0.05 .

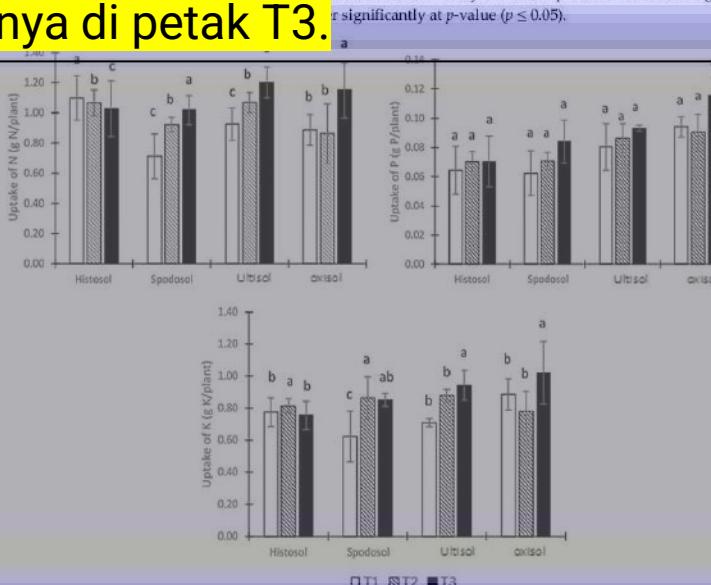

Figure 5. NPK uptake by the seedlings at time of harvest. Vertical bar represents the standard deviation.
different letters represent significant differences in Tukey's HSD comparison. Means sharing the same letter across treatments do not differ significantly at p-value ($p \leq 0.05$).

Secara keseluruhan, anak benih yang ditanam dalam ultisol bawah T3 mempunyai kadar penyerapan NPK tertinggi.

From the present study, the addition of biofertilizers alongside with chemical fertilizers have shown not only enhanced oil palm seedlings growth in terms of the height, girth size, and chlorophyll, it also improves the nutrient uptake of the seedlings and soil nutrient status at a reduced rate of chemical fertilizer. Reduction on the rate of the chemical fertilizer may be needed to avoid over-fertilization of the oil palm seedlings.

(Aaronn, Rosazlin A, Tau Chuan L, et al. (2020).

Dari kajian ini, penambahan baja bio bersama dengan baja kimia menunjukkan bukan hanya peningkatan pertumbuhan benih kelapa sawit dari segi ketinggian, saiz lilitan, dan klorofil, tetapi juga meningkatkan penyerapan nutrien anak benih dan status nutrien tanah dengan pengurangan kadar baja kimia. Pengurangan kadar baja kimia mungkin diperlukan untuk mengelakkan pembajaan anak benih kelapa sawit yang berlebihan.

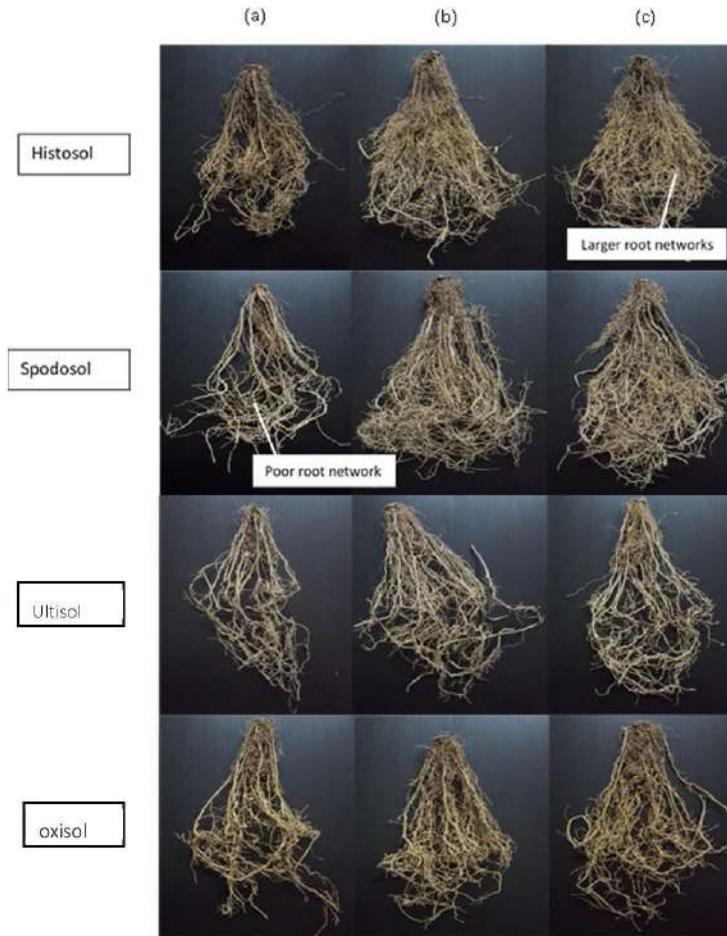

Figure 6. Roots of oil palm seedlings at the end of treatment. (a) T1, (b) T2, and (c) T3. The roots of oil palm seedlings treated with T3 were more in number, longer with more root hairs followed by seedlings in T2 then 100% T1 plots.

4. Discussion

4.1. Growth Performance of Fronds

FAO in 2011 states that about 175.5 million tons of chemical fertilizer is used in agriculture to achieve an optimum crop yield [29]. The enormous amount of chemical fertilizers deposited into soil causes a severe pollution of the river and groundwater which poses serious environmental

Abstrak

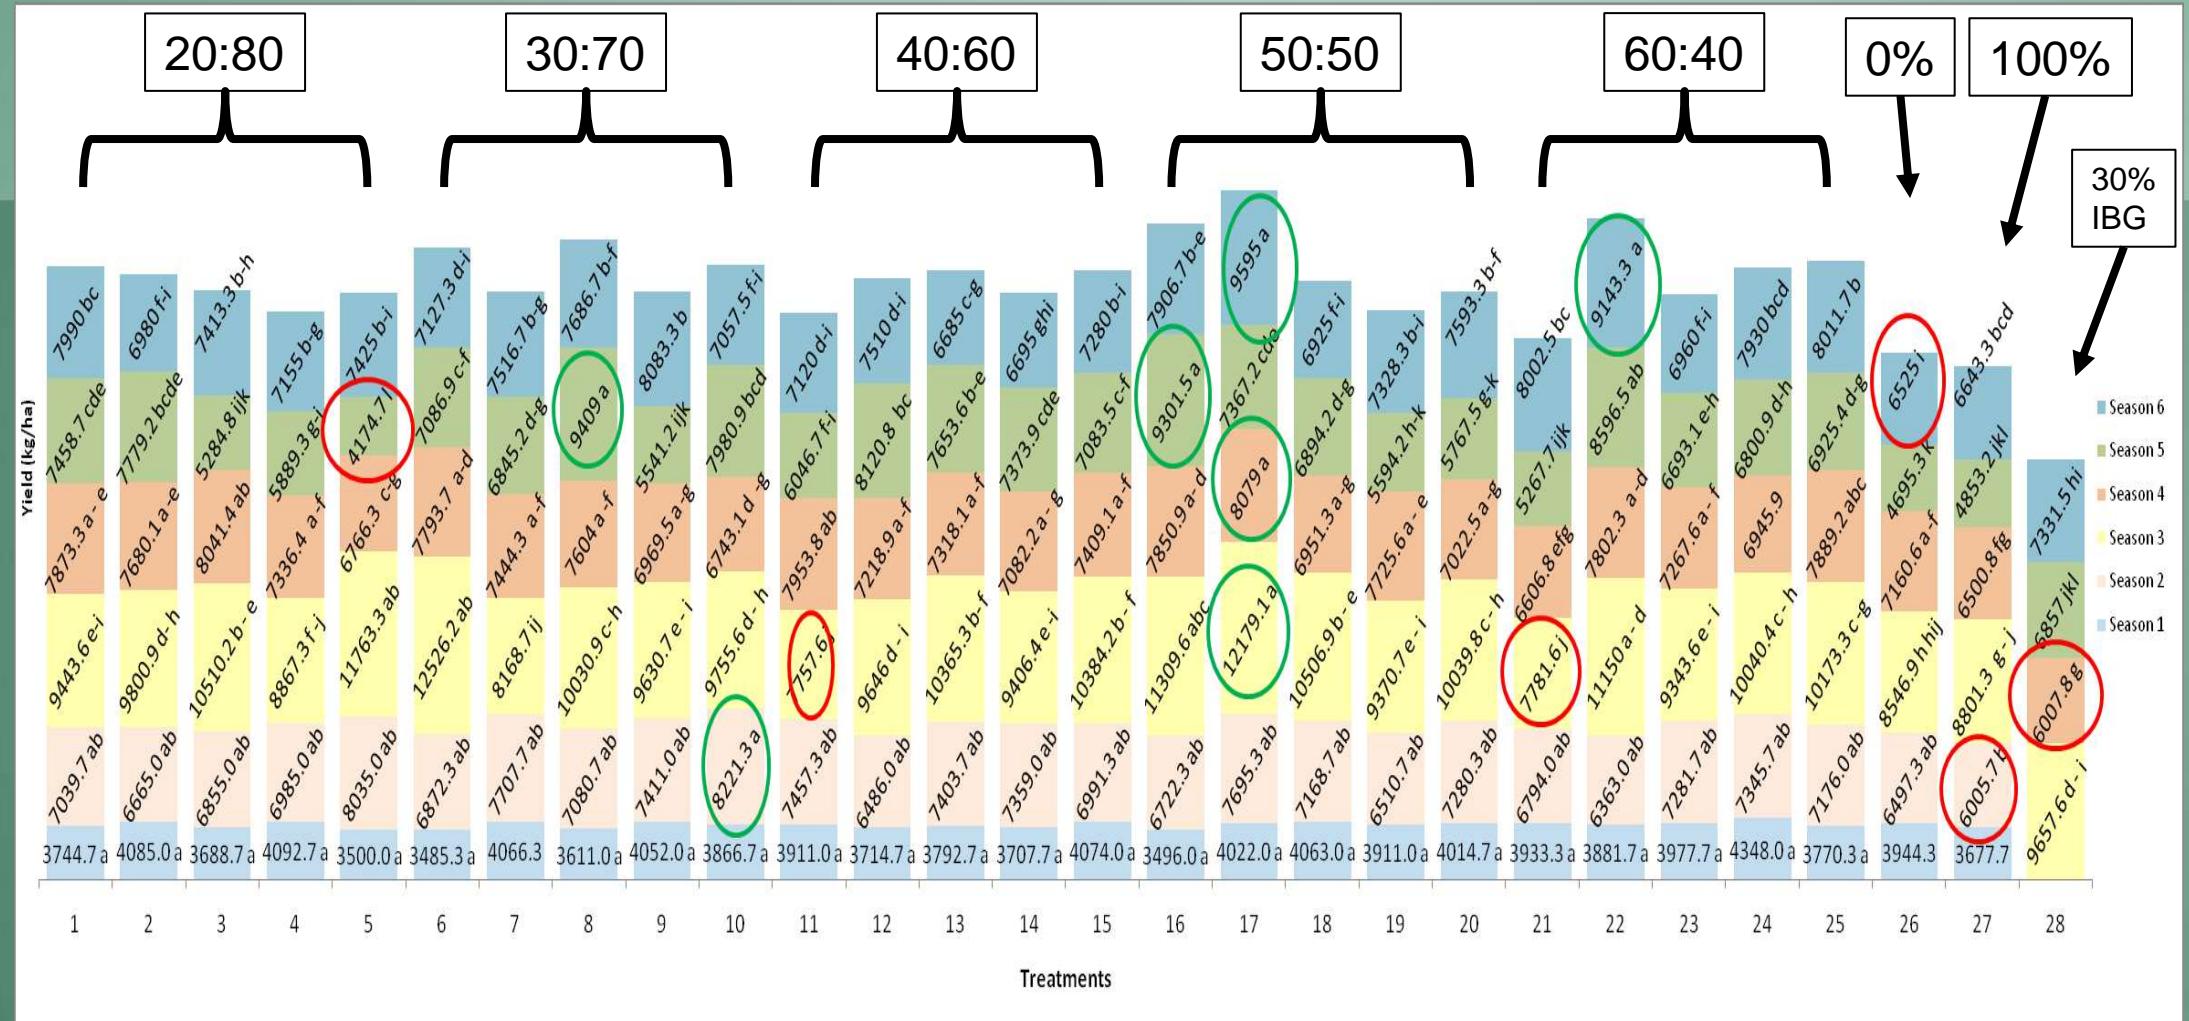

- Satu Perjanjian Kolaborasi untuk menjalankan kajian di antara MARDI dan IBG Manufacturing Sdn. Bhd. telah dimeterai pada 11 April 2017. Kajian ini dilaksanakan di MARDI Tanjong Karang selama 6 musim penanaman dalam tempoh jangkamasa 40 bulan. Objektif utama kajian ini ialah untuk menentukan kombinasi IBG Multipurpose Bio Fertilizer dan baja subsidi untuk keperluan pembajaan tanaman padi. Dapatan kajian menunjukkan aplikasi rawatan T17 (kombinasi nisbah 50:50 (IBG:baja subsidi) dengan kadar 5 liter/ha merupakan rawatan yang terbaik kerana trend hasil yang tertinggi secara ketara pada musim 3, 4 dan 6. Perbezaan peningkatan hasil bagi musim terakhir iaitu ke-6 adalah sebanyak 40% berbanding dengan T26 (plot kawalan tiada pembajaan). Bilangan tangkai turut dipengaruhi secara ketara oleh rawatan dan mempunyai kolerasi positif dengan hasil. Penggunaan produk IBG juga didapati turut meningkatkan populasi mikrob di dalam tanah yang turut mempengaruhi peningkatan positif terhadap nitrogen, fosforus, kalium dan konduktiviti di dalam tanah..

Perubahan pH mungkin menyebabkan perubahan struktur dan fungsi mikro yang membawa kepada pengurangan total soil carbon, total phosphate dan available phosphate. Produk yang mengandungi bakteria pengikat nitrogen memberikan peningkatan total nitrogen dan menyumbang kepada perubahan soil C:N

Kajian selama 3 tahun (6 musim) menggunakan baja bio IBG menampakkan peningkatan ketara dalam bakteria tanah. Rajah 1 menunjukkan bahawa rawatan plot mempunyai TPC yang jauh lebih tinggi daripada plot yang tidak dirawat (plot kawalan).

YBrs Dato'
Laporan Akhir Projek Kolaborasi MARDI-IBG MANUFACTURING SDN BHD

Adalah dimaklumkan, surat dari pihak MARDI MDI/PR2/PA/29-02 adalah dirujuk.

2. Setelah perbincangan dan pembentangan laporan hasil kajian, dengan ini pihak MARDI telah memenuhi obligasi 6.1 dan 10.1 seperti termaktub dalam perjanjian kolaborasi bertarikh 11 April 2017 dan bersama-sama ini disertakan laporan akhir kepada pihak IBG MANUFACTURING SDN BHD.

3. Kerjasama pihak YBrs Dato' didahului dengan ucapan ribuan terima kasih

(DR. HARTINEE BINTI ABBAS)

Ringkasan Laporan Kajian

Satu Perjanjian Kolaborasi untuk menjalankan kajian di antara MARDI dan IBG Manufacturing Sdn. Bhd. telah dimeterai pada 11 April 2017. Kajian ini dilaksanakan di MARDI Tanjung Karang selama 6 musim penanaman dalam tempoh jangkamasa 40 bulan. Objektif utama kajian ini ialah untuk menentukan kombinasi IBG Multipurpose Bio Fertilizer dan baja subsidi untuk keperluan pembajaan tanaman padi. Dapatkan kajian menunjukkan aplikasi rawatan T17 (kombinasi nisbah 50:50 (IBG:baja subsidi) dengan kadar 5 liter/ha merupakan rawatan yang terbaik kerana trend hasil yang tertinggi secara ketara pada musim 3, 4 dan 6. Perbezaan peningkatan hasil bagi musim terakhir iaitu ke-6 adalah sebanyak 40% berbanding dengan T26 (plot kawalan tiada pembajaan). Bilangan tangkai turut dipengaruhi secara ketara oleh rawatan dan mempunyai kolerasi positif dengan hasil. Penggunaan produk IBG juga didapati turut meningkatkan populasi mikrob di dalam tanah yang turut mempengaruhi peningkatan positif terhadap nitrogen, fosfor, kalium dan konduktiviti di dalam tanah.

CONFIDENTIAL

This Product Commercialization Agreement dated 8th September 2017 (hereinafter referred to as this "Agreement").

BETWEEN

MALAYSIAN AGRICULTURAL RESEARCH AND DEVELOPMENT INSTITUTE a statutory body incorporated in Malaysia under the Malaysian Agricultural Research and Development Institute Act 1969 [Act 11] and having its headquarters office at MARDI Headquarters, Persiaran MARDI-UPM, 43400 Serdang, Selangor Darul Ehsan, (hereinafter referred to as "MARDI") of the one part;

AND

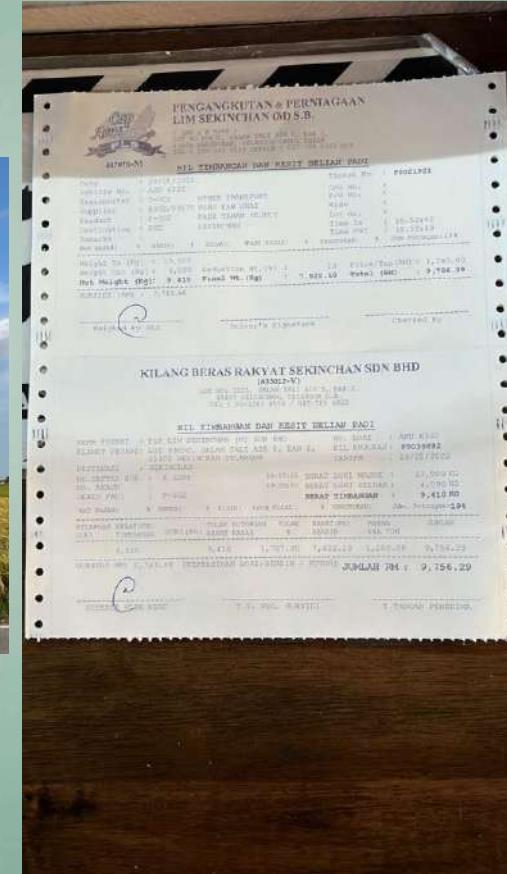

IBG MANUFACTURING SDN. BHD. (Company Registration No.: 199801017236 (473365-H)) a business registered under the law of Malaysia and having its registered address at Suite 9-13A, Level 9, Wisma UOA II, Jalan Pinang, 50450, Kuala Lumpur, Wilayah Persekutuan and its business address at No. 3, Jalan TPP3, Taman Perindustrian Putra Puchong, 47130, Selangor (hereinafter referred to as "the Company") on the other part.

MARDI and the Company are hereinafter referred to as "the Parties" collectively and each as "the Party".

WHEREAS:

- A. MARDI and the Company has entered into the Collaboration Agreement in relation to the "Development of IBG Multipurpose Bio Fertilizer for Rice Cultivation" dated 11 April 2017 (hereinafter referred to as the "Collaboration Agreement"). Pursuant to Clause 13 of the Collaboration Agreement, the Parties agree that any future commercialization of IBG Multipurpose Bio Fertilizer in relation to the rice cultivation shall be formalized and secured in a separate written agreement detailing the rights and responsibilities of the Parties, including any financial commitments (if any).
- B. Pursuant to the above, the Company is desirous to produce, market, distribute and sell the IBG Multipurpose Bio Fertilizer for rice cultivation in any territory / country in the world and MARDI agrees for the Company to lead the commercialization of the IBG Multipurpose Bio Fertilizer subject to the terms and conditions as stated in this Agreement.
- C. For the purpose of the Company commercializing the IBG Multipurpose Bio Fertilizer pursuant to this Agreement, both Parties agree to name and commercialize the IBG Multipurpose Bio Fertilizer for rice cultivation as "IBG Paddy Bio Fertilizer" (hereinafter referred to as "the Product") subject to the terms and conditions hereinafter set forth in this Agreement.

...kurangkan penggunaan baja berasaskan nitrogen

Bayer bets on agro-biotech

It will jointly develop biological solutions to use less nitrogen-based fertiliser

BY P J HUFFSTUTTER

CHICAGO: Germany's Bayer AG, one of the world's biggest agricultural **chemical companies**, is joining a US\$100 million (RM420 million) bet that the next big breakthrough in crop fertilisers will be found inside a biological Petri dish.

Its Bayer LifeScience Center division, along with biotech firm Ginkgo Bioworks, is forming a start-up to focus on developing biological solutions to reduce the use of ni-

trogen-based fertiliser, or make farmers' use more efficient, company officials said this week.

The venture will be backed via a Series A investment from the two companies and hedge fund Viking Global Investors LP. The funding round closed on Wednesday. Bayer and Ginkgo Bioworks officials declined to discuss financial details or individual investment amounts.

The still unnamed business will focus on plant-based microbes, particularly finding ways for mi-

croorganisms to help plants and the soil assimilate nitrogen molecules from the air or other sources, Ginkgo Bioworks chief executive officer (CEO) Jason Kelly said in an interview.

The effort is part of a broader push in agricultural research to harness the microorganisms in plants and soil and, among other things, use them to improve crop yields or allow plants to thrive on lower amounts of fertiliser.

Reducing the amount of nitro-

gen fertiliser needed to feed plants could ease environmental concerns over water contamination from nitrogen fertiliser run-off and related greenhouse gas emissions, company officials said.

Michael Mihile, a vice-president at Bayer Crop Science's biologics group, said launching this venture as a start-up was intended to keep it more nimble.

"Everything is designed for speed," said Mihile, who will serve as interim CEO. — Reuters

IN BRIEF

VW CEO says has no plans to divide up the group

FRANKFURT: Volkswagen (VW) has no plans to follow local rival Daimler in considering changing the group's legal structure, its chief executive officer (CEO) said, even as the company undergoes the biggest transformation in its history. The world's largest vehicle maker by sales said on Monday it was stepping up the pace on its electric-car programme, announcing more than €20 billion (RM100 billion) of new investments over the next 12 years. Asked by reporters at the Frankfurt auto show whether he could imagine following rivals in looking at changing the group's structure, CEO Matthias Mueller said: "Others are always faster than

KELEBIHAN UNIK

1. Meningkatkan penggunaan bahan organik tanah, dengan itu mengurangkan hakisan tanah
2. Menambah baik pengangkutan nutrien melalui rembesan semulajadi akar elemen faktor pertumbuhan oleh mikrob
3. Mengurangkan kerugian yang disebabkan oleh hujan melalui bakteria Fosforus dan Kalium
4. Meningkatkan pertumbuhan tanaman
5. Meningkatkan kadar pembunggan dan nisbah bunga betina
6. Meningkatkan berat buah dan kualiti
7. Membekalkan baja nitrogen yang tidak berasid

Semua kesan di atas boleh dilihat dalam tempoh 3 bulan - 3 tahun selepas aplikasi.

IBG Manufacturing Sdn. Bhd.

IBG Manufacturing Sdn. Bhd.

IBG Manufacturing Sdn. Bhd. mempunyai kilang sendiri di Malaysia sejak 1998. Ia diperbadankan pada bulan Julai 2004, di bawah IBG Bio Ventures Sdn. Bhd. Modal berbayar IBG Manufacturing adalah RM 2 juta.

LETTER OF AWARD OF BIONEXUS STATUS AND TAX INCENTIVE TO
IBG MANUFACTURING SDN BHD (473365-H) ("the Company")
BioNexus Ref. No.: BNX-4100437

We refer to the following documentation submitted by the Company to our Client Support Services Division:
 (a) the completed BioNexus Status application form dated 24 March 2008 applying for
 (b) the final business plan, financial projections and relevant documents;
 (c) all agreed variations or modifications to the above mentioned documents in
 paragraph (b) above pursuant to letter/ meeting if any;

collectively to be referred to as the "Application Documents".

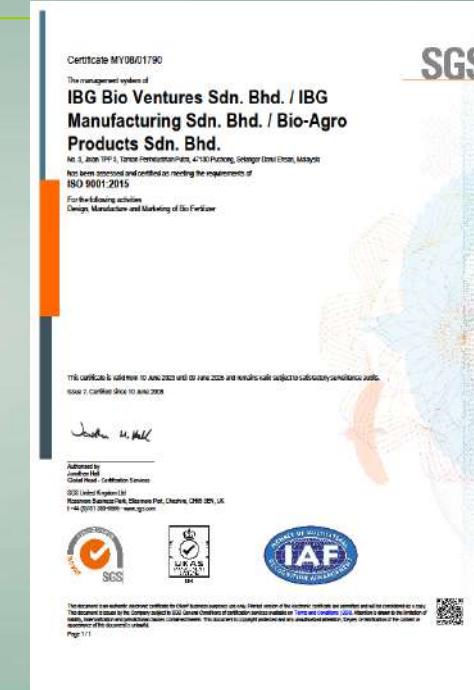

We are pleased to inform you that the Minister of Finance, in concurrence with the recommendation made by Malaysian Biotechnology Corporation Sdn Bhd, has APPROVED your Company's application for the BioNexus Status and 100% tax exemption of the statutory income for a period of ten (10) years under Income Tax (Exemption) (No. 17) Order 2007 (U.A. 17) dated 20/06/2007 ("Exemption Order"). Kindly take note that the Company has been conferred the BioNexus Status and tax exemption subject to its acceptance of such status and full compliance with the attached Terms and Conditions:

a) Qualifying Activities.
The Company must conduct only the following Qualifying Activities:
Research, development and production of bio-fertilizers.

b) Location of Operations.
The Company must conduct the Qualifying Activities at the following location:
No. 3, Jalan 1PJK 1/3
Taman Perindustrian Kuantan
47100 Puchong,
Selangor,
Malaysia

PENYELIDIKAN DAN PEMBANGUNAN

IBG Manufacturing Sdn Bhd telah membina pusat R & D yang berteknologi tinggi untuk menyokong inisiatif R & D yang kukuh. Pusat R & D memberi tumpuan kepada teknologi terkini, daripada penyelidikan meluas kepada pembangunan produk bertaraf dunia baja bio dengan hak harta intelek milik sendiri dan potensi pemasaran yang hebat.

Kami telah menubuhkan bidang eksperimen dan kerjasama dengan institusi penyelidikan yang terkenal di Malaysia dan China sebagai usaha untuk memastikan kenaikan taraf dan inovasi produk yang berterusan.

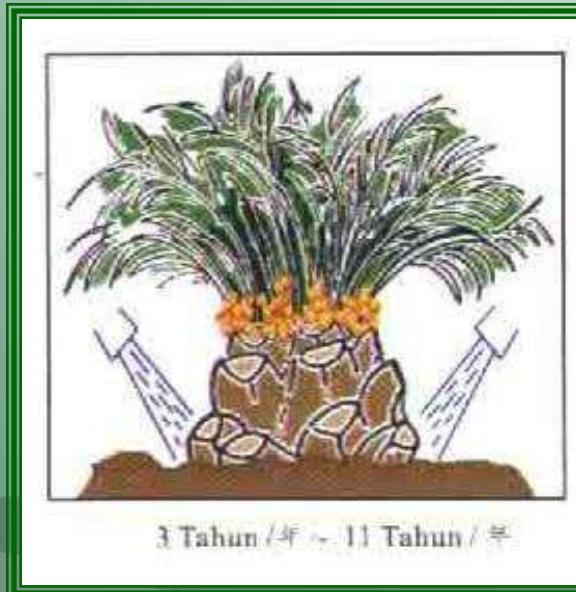

Kaedah aplikasi untuk kelapa sawit

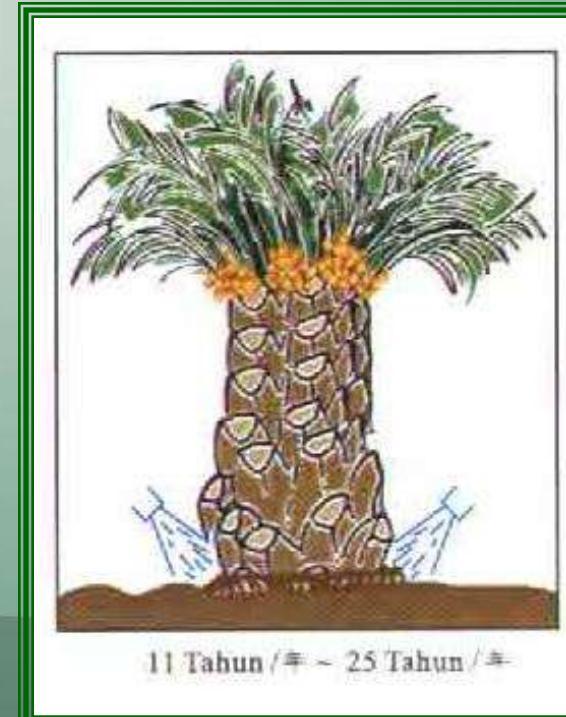

Kelapa sawit

6 bulan – 3 tahun

3 tahun – 11 tahun

11 tahun – 25 tahun

Kaedah aplikasi baja bio IBG

Analisis Kos Buruh:
Seorang pekerja 7 jam kerja dapat meliputi kira-kira 2.5 hektar (324 pokok)

Semburkan akar dan batang. Pastikan semburan cukup basah pada kadar 1 lt./ pokok
< Kiri dan semburan pada paras 1 kaki dari paras tanah. Semua bahagian akar atau dicelah pertemuan antara tanah dan batang pokok disembur cukup basah.
Bagi Pam CKS 16 lt, semburan untuk 16 pokok sahaja.

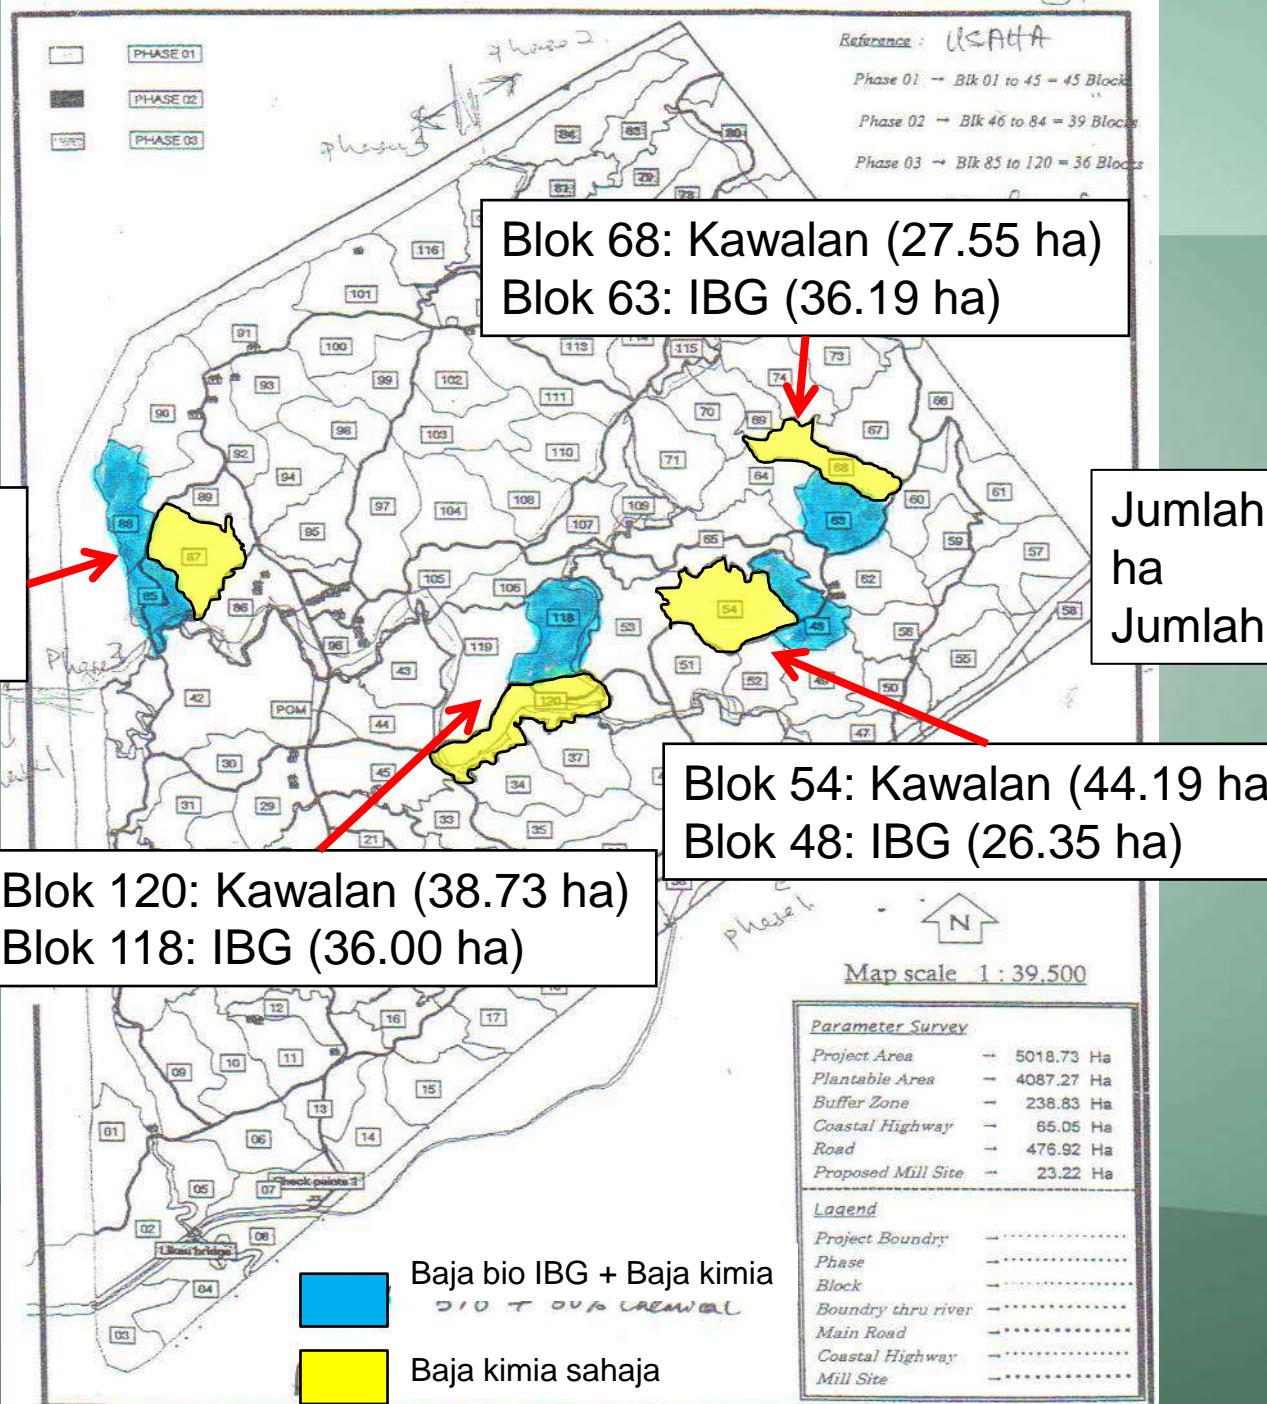

Kalibrasi dengan bekas pengukuran untuk mengukur bilangan strok untuk satu liter.

DATE : 25th May 2010

Kami tidak teragak-agak untuk mengesyorkan mana-mana pelanggan atau syarikat untuk menggunakan produk ini yang mana ia adalah faedah bersama bagi tujuan jangka panjang

To Whom It May Concern:

This serve to certify that the IBG Microorganism Bio Fertilizers is a high technology product which Woodman Group Of Companies are using such as Usaha Sepadan Estate on mineral soil. Tamar Estate, Tatau Estate and Semanok Estate are on peat area for several years, area coverage approximately 18,000 Ha since 2003 till at present.

After using this IBG-BIO Fertilizers product, it is proven that this product really benefits us through cost saving at 20% generally, maintain and improve its productivity, reducing labour cost, improve the soil structure and maintain adequate soil moisture without extra cost where the quantity of micro-organism in the soil create healthy natural environment for the palm growth where we reduce our chemical cost at 30% generally.

We do not hesitate to recommend any clients or company to use this product where it is mutual benefit for long term purposes.

Thank you,

Yours truly,
WOOMAN KUALA BARAM ESTATE SDN. BHD.

MR. ANTHONY JAU

TO WHOM IT MAY CONCERN

Ladang Jobenar Raya Sdn Bhd commenced using IBG Oil Palm Bio Fertilizer combined with Chemical Fertilizer for oil palm growth and sustainable yield improvement in 2006 until now.

Over the past 4 1/2 years of usage of IBG Bio- Fertilizer, the average yield increase was 18.25% as compared over the control blocks.

For sustainable palm oil production, integrated use of chemical and bio-fertilizer has shown to have a significant improvement in sustaining soil health through earthworm cast formation on the soil surface for oil palm production, reduction dosage of NPK by positive improvement in terms of foliar nutrients level,cost saving and good yield improvement by about 20% over the complete usage of conventional fertilizers.

Currently, our group of eight peat and mineral soils oil palm estates covering a hectarage of 18,885 10 hectares is using the IBG Bio Fertilizers on a large and commercial scale.

For best results, IBG Bio-Fertilizer should be integrated with mineral fertilizers and the latter can be reduced by 20 - 30%

Yours faithfully,

CHAN WING SAN
Operations General Manager

Sepanjang 4 tahun setengah yang lalu menggunakan baja bio IBG, peningkatan hasil purata adalah 18.25% berbanding ke atas blok kawalan

Untuk hasil yang terbaik, baja bio IBG harus digunakan bersama-sama dengan baja kimia dan baja kimia tersebut boleh dikurangkan sebanyak 20-30%.

Too dry for microbes duplication

About 45 days later

Photo on 27/3/2008

With help of ground cover and recent rainfall, microbes start fix nitrogen for palm.

Corrective recommendation

Dosage : Urea 0.5 kg + MOP 0.5 kg

Timing : April

Application : Incorporate with 1.25 kg 9:9:12:4, total 2.25 kg

Dosage : Extra IBG Bio Fertilizer 15 ml

Timing : May

Application : Incorporate with 10 ml IBG Bio, total 20 ml dilute in 1.5 liters water per palm

Dengan kelembapan yang mencukupi, kelapa sawit telah pulih.

Palm A (Blok 2 Calon pokok)

Sebelum

Selepas

- Bilangan tandan dalam kelapa sawit ini mempunyai potensi untuk mendapat hasil yang banyak sebelum aplikasi baja bio IBG. Selepas aplikasi baja bio IBG, bilangan tandan telah meningkat.
- Dari pemerhatian mata dan melalui kiraan tandan, bilangan tandan kelapa sawit ini telah meningkat 2 - 3 tandan secara purata. Kesan selepas menggunakan baja bio IBG dapat dilihat dari 6 - 12 bulan selepas aplikasi, walau bagaimanapun, berat tandan, hanya akan dilihat selepas aplikasi untuk jangka masa panjang.

Palm B (Blok 2 Calon pokok)

Sebelum

Selepas

- Kelapa sawit ini hanya mempunyai beberapa bunga jantan sebelum aplikasi baja bio IBG. Selepas IBG Bio Fertilizer telah digunakan, pokok ini tidak mempunyai bunga jantan dan buah tandan adalah lebih besar berbanding dengan yang sebelum aplikasi.

IBG Nursery

Gambar 1: T1B: Baja bio IBG + Kadar berkurang baja kimia; T3C: Baja kimia sahaja

Gambar 3 & 4: Perbandingan akar di antara T1 (Baja bio IBG + Kadar berkurang baja kimia) and T3 (Baja kimia sahaja)

IBG Nursery result

Akar: Berat basah T1 adalah	18%	lebih berat daripada T3
Akar: Berat kering T1 adalah	25%	lebih berat daripada T3
Pelepah: Berat basah T1 adalah	11%	lebih berat daripada T3
Pelepah: Berat kering T1 adalah	20%	lebih berat daripada T3
% Kandungan: Kelembapan of Akar T1 adalah	15%	lebih daripada T3
% Kandungan: Kelembapan of Pelepah T1 adalah	7%	lebih daripada T3

T1: Baja bio IBG + Kadar berkurang baja kimia;
T3: Baja kimia sahaja

To whom this may concern,

Truthfully, we have been struggling finding the right supplement for the palms to grow healthily through sustainable ways. When the IBG was introduced back in the days, the effects were seen. Result were observable might vary due to the condition and type of the soil. Make it in three years supervision, if the sustainability of the plantation is maintained, why don't we give a try proceeding its usage? It resembles a good definition of bio-friendly product that will help a lot planters to move forward with legit mission and vision.

Thank you.

Sr. Regional Manager (Sabah)
Hadraui Mohd Arip

Kami memberi galakkan kepada mana-mana pelanggan atau syarikat untuk menggunakan produk ini untuk mendapat manfaat jangka masa panjang.

TAMACO PLANTATION SDN. BHD.

P.O. Box 60486,
91114, Lahad Datu Sabah.

Date: 26th January 2022

To whom this may concern,

Tamaco Plantation Sdn. Bhd. has been using IBG biofertilizer since year 2006 until now in the oil palm plantation in Bintulu and Lahad Datu with a total hectarage of about 20,000.

More than 15 years after using the IBG biofertilizer, the main effects we had seen is that the oil palm yield has been increased and maintained at 28 – 29 mt/ha when compared with non-treatment oil palm. We had witnessed the recovery and improvement of the soil's quality and structure. While our neighboring estates suffering from high infection of Ganoderma, the infection in our estate has remained low in relative, less than 2% only.

Besides, with the improvement of soil chemical and biological properties, the palm's physiology has been ameliorated. The frond pruning and bunch harvesting had become easier than before using IBG biofertilizer, thus the cost of the palm and soil's health maintenance and the cost of chemical fertilizer application has been reduced drastically. Also, it is easy to apply in the field.

These effects can only be seen after 3 months – 3 years application of IBG biofertilizer depending on the soil type condition.

Hereby, we encourage any customer or company to use this product for long term benefits.

Thank you.

Sr. Regional Manager (Sabah)
Hadraui Mohd Arip
